

My immediate feeling was that in that length of time, a kind of manifesto is in order. Geisteswissenschaft may be an ambiguous term, but it is a rich one and should be embraced as such – mind, spirit, thought, human cultures fall under its umbrella. Goethe springs to mind as a figure who moved gracefully among various regions of learning, including science, and his critique of mechanism remains potent. I will no doubt trumpet the benefits of epistemological pluralism and the interdisciplinary dialogues already underway in many disciplines. I have been appointed a lecturer in psychiatry at Weill Medical School here in New York and am giving a seminar for psychiatric interns in which we are reading and writing texts of various kinds, and I expect I will refer to that experience as work that is aimed at understanding what we mean by mind, the ill mind, in particular.
